Dear Hiring Manager,

For the past four-plus years I've been embedded on Franklin Templeton's Wealth Management Technology teams as a Brillio contractor, and I'm applying to join the firm full time as Lead Software Engineer for the Account Lifecycle Platform — because AOP 2.0 is the platform I helped found, lead the backend for today, and know from the workflow state tables up.

I've been on the rebuild since its first proof of concept, and I was promoted to lead the backend team on the recommendation of senior architects and management. The two core microservices are mine: the Drools rules engine that governs every UI field and gives clients millisecond, real-time completion validation, and the secure persistence service that is the sole gateway to internal systems. When Camunda's release cadence started forcing code changes on us, I drew on the workflows I had hand-built for CashApp and replaced it in a month with a dynamic orchestration engine on Spring and SQL Server. It carries every account-opening request through validation, assignment, Front Office and Retirement Services approval, KYC, DocuSign signature, and SWP submission, with role-based authorization, retries with backoff, and fault tolerance so no request is ever left broken. New steps are configured in the database, not deployed. I built the document-collection validation and Azure Blob storage behind the DocuSign workflow and have resolved its production incidents, I wrote the LexisNexis screening API from the vendor documentation as the KYC proof of concept, and I built the Streamlit application on Snowflake that the business uses weekly to migrate deprecated AOP 1.0 accounts.

Before AOP I was a core builder and one of two primary production maintainers of CashApp, the money-movement platform, where I designed the event-driven architecture behind its 20+ batch jobs and took production deadlocks from several a day to zero. Every step of my time here was pulled, not pushed: a contract extension after my first project, hand-picked by the lead architect for the second, recommended for the lead role on the third, and converted by Brillio to full-time in June 2025.

Your posting asks for AI fluency, and that is already how my team works. I write test suites from business requirements first, direct agents to implement against them, and gate every change behind agent-driven code review and agent-authored pull requests through GitHub MCP on Copilot CLI, so AI-generated output is validated before it touches anything production-critical. I authored the shared copilot-instructions.md, custom CLI commands integrated with Jira, and a cross-environment database-alignment tool other projects now use, and I onboarded my whole AOP team plus the CashApp and SWP Forms leads onto the approach, including how to cut token usage and get more from each prompt. Since the firm's January 2026 rollout I've ranked in the top 5% on Copilot cost-efficiency with over 30,000 lines of AI-assisted code accepted into production. I taught myself these workflows on personal time with Claude Code and translated them onto the approved tooling the day it was enabled.

I want to keep going deeper. I'm currently working toward the Anthropic Claude Certified Developer and Microsoft Azure AI & Agents Developer Associate certifications, and joining full time would let me use the Learning Education Assistance Program to formalize that path, through further certifications and, if it serves the platform, additional schooling in AI engineering.

I'm based in California and have worked full Eastern-time hours since 2022. I'm open to the three-day hybrid schedule at a Franklin Templeton location and happy to discuss which one.

My resume is attached. I'd welcome the chance to talk about where AOP goes next.

Sincerely,
Mark Park
